

The way nature intended.

POULTRY FEEDING DIRECTIONS

How and When to Feed:

1. Feed *Nature's Best Organic Broiler Starter* as the sole ration to baby chicks from hatch to 21 days of age. Each bird will consume about three (3) pounds of feed during the three-week period.
2. Feed *Nature's Best Organic Pullet Grower Developer* starting at 22 days of age to young layers or dual purpose birds and feed approximately 12 pounds of pullet grower developer until the birds begin laying at 18-22 weeks of age.
3. Once laying begins, switch to *Nature's Best Organic Egg Layer Pellets*. Feed as the sole ration to free-range and confined laying chickens after 18 weeks of age and throughout the laying cycle. *Nature's Best Organic Egg Layer Pellets* can be fed to both male and female chickens, ducks, geese, and turkeys.
4. For meat birds feed *Nature's Best Organic Broiler Grower* as the sole ration from day 22 to market. The amount necessary depends on the breed of chicken, weather, and the weight at market. The birds will consume approximately 2 – 2 ½ pounds of feed per pound of gain.
5. *Nature's Best Organic Scratch* is available to provide organic whole grains and cracked corn to layers, broilers, and turkeys. No feeder is required and encourages scratching for pasture poultry.
